

Towards a Conceptual Framework for the Conservation of Urban Heritage

Harsha Munasinghe

Men come together in the city, Aristotle wrote, in order to live. They remain a group in order to lead a good life. The ordered system of meanings and symbols in terms of social interaction evolved by individuals as members of a group is called culture¹. Their dwelling in urban space, by encoding and decoding meanings according to the norms dictated by their cultural values, gives the city its *raison d'être*, that in turn gives orientation and identity to societies in space and time. This evolved essence of the urban space, enhancing Man's knowledge of Man, accrues a heritage value by documenting a transformation of a culture, and its protection secures a cultural continuity². Ever since the concept of time was known, symbols of the past were appreciated for reinforcing a cultural continuity. This past proclaimed by mythology, ideology, nationalism, local pride, or romantic ideas, is the heritage³. The particular way of proclaiming a heritage by ascribing diverse values on it moulded each culture with a unique identity. Among the values ascribing on heritage moulded each culture with a unique identity. Among the values ascribed on heritage are documentary, historic,

nationalistic, aesthetic, religious, age, memorial, cultural, use, and market values, and they are given emphasis according to the contemporary cultural consciousness in order to place the protected heritage within the evolving value system.

As such, the protection of cultural heritage, that is a moral duty of each cultured man, demands to be framed within the concept of heritage, the concept of value, and the concept of dwelling. The evolution of the concept of heritage is twofold; it proclaims the 'entire corpus of material signs of a culture' rather than a few monumental cases⁴, and it is jointly - owned by a wider community not an inheritance of a privileged class and more. This, diluting of the concept of heritage from easily identifiable objects to evidence of a culture, has sometimes caused a supplanting of tangible values by diffuse ones, limiting protection actions of urban heritage by placing priorities with nationalistic or religious values, in which the urban setting is reduced into a setting of a monument that derives a significance largely by being placed in it⁵. It has also

¹ This learned behavior as members of a group on contrary to the genetically- endowed one is understood by the anthropologists as culture. Also Refer Greetz (1973) - The Interpretation of Cultures, New York ..

forced to identify and present a signified unity of an urban setting. This evolution pattern has not been contributory in appropriating evaluation tools to assess the urban heritage, simply because it is dominated by reactions to contemporary issues such as the destruction during World War II or making of Nation states, and failure to define urban heritage along with the life generated in urban space. Today, conservationists identify a signified unity of a geographically-delimited urban area, a walled quarter, a street, etc., delineate it with architectural or historical criteria, and protect this unity by placing priorities with the physical fabric at the expense of true heritage values⁶. As a result, the evolution of the cultural patterns are being neglected. The erosion of life in protected urban settings shows how detrimental this has been⁷. Urban, being an environmental quality reflected by the way of life, rather than demographic intensity or activities⁸, urban heritage is an inheritance of a particular evolution pattern of an urban culture⁹.

⁹ Faulkner, P.A. (1978) - 'A Philosophy for the Preservation of our Historic Heritage', in Journal of the Royal Society of Arts, 126 (5, 264), divides heritage in to two as heritage of ideas and heritage of objects, and shows how intricate the concept of heritage is.

The concept of value, that is well developed in teleological and deontological ethics, helps to categorize the intangible values that are attached to the heritage into two as intrinsic and inherent¹⁰. Age value, historic value, and architectural value are examples for intrinsic values whereas cultural significance, and historic importance are examples for the inherent values. The externally - enforced values such as tourist or market values cannot be discussed within these two categories. Thus it is necessary to introduce a third, the extrinsic value. It is a fact that these terms are discussed differently by philosophers, some even promoting 'merit' instead of value. As a common tendency, they define the intrinsic value as the one that lies independent of the value, that is supervenient on being a moral subject, could remind a moral duty to protect a heritage. While intrinsic values address emotions and intellects independently, the extrinsic values promote a destruction of heritage. An urban setting, being a heterogeneous - homogeneity¹¹, possesses diverse values. Hence, a proper evaluation of these values in order to prioritize them should be able to support rendering a true protection.

By ascribing inherent values, the duties to protect a heritage can be promoted either as norms or paradigmatic expanse, Inherent value is not the good of moral norms, such as duties of respect, that are binding on moral agents in their relations to non human moral subjects. It is the opposite, because moral agents are bound by moral norms in relation to moral subjects, that have a moral status and a moral status value which may be called inherent values. Since the norms and values determine

A working paper for UNESCO

the identity of a culture, ascription of inherent values is the most appropriate in terms of facilitating a cultural continuity by placing a proclaimed heritage within the context. On the contrary, the intrinsic value, that is derived from the object independent of the context, gives rise to undue attention and mis-interpretation of the heritage.

The concept of dwelling has attracted the attention of conservationists, who note conservation as a way of giving bearings to the living societies¹². Yet, their attempts are often based on architectural or historic criteria rather than accommodating perception and reaction of everyday users of the setting, thus hardly orientated to identify the way of conceiving a setting by the everyday users¹³. The reciprocal relationship between the society and the setting can be noted by carefully mapping the particular pattern of place-making. If this is enhanced by protecting physical attributes, activities, and concepts¹⁴, the setting would be protected for cultural values.

Phenomenologists consider that 'place' positions Man in such a way that it reveals the external bonds of a person's existence and the depth of his/her freedom and reality at the same time¹⁵. As such phenomenological values are the most culturally –significant values of urban space, that is often a non-

celebrated history or a non-intentional monument¹⁶. Because they document the particular dwelling patterns of the life lived, thus the cultural patterns evolved in it. Once the place – making by different sub- cultural groups should be respected, the diversity of urban heritage would also be protected thus reinforcing its capacity in supporting a cultural continuity. Dwelling is paid least attention by architects, who are busy with creating master –pieces for themselves, and it has been continuously neglected by the conservationists who are largely architects. The essential task of an architect is enabling the place – making in the sense of endowing a considerable part of the human environment with a special order¹⁷, and the essential task of a conservationist would thus be to ascribe the space with inherent values that facilitate place-making¹⁸.

The word conservation is popular in many contexts. Its widest ramification promotes a management of an object that is in the process of aging or transmission. Yet, conservation is commonly understood as saving. With the rise of architectural and urban conservation after the World War Two, it is understood as preserving and presenting a history. These should be replaced by emphasizing its capacity to promote the appropriate use of resources in time and space, rather than petrifying expressive elements such as built forms or facades or surface materials. The conserved heritage is a joint product of yesterday and today, and it is intended for a

¹² Ralph, E. (1976) – *Place and Placelessness*, London., has gone beyond the plain discussion to establish that conservation of environmental settings is able to enable place – making.

better tomorrow. As such, conservation is more an investment than a saving.

The conservation approach practiced globally can be categorized in to three types¹⁹. They are the traditional approach that aims at preserving the use values, the romantic approach, that evolved with romanticism and nationalistic ideas during the Italian Renaissance, and the historic approach that developed with an emphasis over the documentary values and authenticity. John Ruskin and William Morris could be considered as the pioneers of this third approach which blossomed after the World War II. These approaches are based on intrinsic values, and promote extrinsic values thus endangering a cultural heritage by fencing off from the context, by prioritizing a physical fabric, by drawing undue attention or by making the past superior to the present. As a whole, they have failed to enrich a culture or make the society intelligible. Keeping the history in exhibition to look at has also promoted its neglect²⁰.

¹⁹ Jokilehto, J. (1988) – 'Conservation Principles and Theoretical Backgrounds', in *Durability of Building Materials 5*. Amsterdam., describes the three approaches convincingly.

²⁰ Marcuse, Peter (1974) – 'Conservation for whom?', in J.N. SMITH (ed.) *Environmental Quality and Social Justice in Urban America*. Washington DC., analyses the case of Williamsburg, Virginia where one historic moment is frozen as a tourist-object.

Protecting documentary values for the sake of creating a historic consciousness does not necessarily support a cultural continuity as the proclaimed heritage could also symbolize a repressed past, or neglected the current cultural consciousness. In the multi-cultural settings such as post colonial cities, none of them can protect the values of an urban heritage. There is a demand for a fourth approach, that assesses all merits of heritage as a whole, and protects it by ascribing inherent values. This threefold approach; first evaluating values, second appropriating actions, and third ascribing inherent values, embraces the particular evolution patterns of the environmental quality that supports the place – making capacity.

Thus identifying the evolved urban quality as the basis for intervention could promote the living communities as the true guardians who realize the protection at site. By recognizing their living as essential for the enrichment of the heritage value of urban space, or in short once conservation values are derived within the present cultural consciousness, a true protection could be rendered. By bringing cultural values to the centre of decision making with regards to development, conservation of urban heritage could be promoted as the vehicle of realizing a promising future.

Harsha Munasinghe holds a PhD from the University of Oulu in Finland and is a Post Doctoral Researcher there. He also works as a reserach consultant at the city of Helsinki- Urban Facts. He is a visiting lecturer at the Helsinki University of Technology.
